1. INTRODUCTION

1.1 Project Overview

IoT-based agriculture system helps the farmer in monitoring different parameters of his field like soil moisture, temperature, and humidity using some sensors. Farmers can monitor all the sensor parameters by using a web or mobile application even if the farmer is not near his field. Watering the crop is one of the important tasks for the farmers. They can make the decision whether to water the crop or postpone it by monitoring the sensor parameters and controlling the motor pumps from the mobile application itself.

The parameters like temperature, humidity, and soil moisture are updated to the Watson IoT platform. The device will subscribe to the commands from the mobile application and control the motors accordingly. APIs are developed using Node-RED service for communicating with Mobile Application. A mobile application is developed using the MIT App inventor to monitor the sensor parameters and control the motors.

1.2 Purpose

In order to meet the current global needs of humanity, new solutions and technologies are constantly being proposed and implemented. This has led to the advent of the Internet of Things (IoT). IoT is defined as the network of all objects that are embedded within devices, sensors, machines, software and people through the Internet environment to communicate, exchange information and interact in order to provide a comprehensive solution between the real world and the virtual world . In recent years, IoT has been applied in a series of domains, such as smart homes , smart cities , smart energy , autonomous vehicles , smart agriculture , campus management , healthcare , and logistics . Series of other IoT applications have been described by Shafique et al.

In recent years, with the aim of increasing agricultural production, new solutions and technologies have been introduced in the agriculture sector . An emerging trend is the application of the IoT and big data. A significant number of studies have been focused on research, experiments, and applications . According to the Cisco forecast, over 500 billion IoT

devices will be connected to the Internet by 2030 . The use of IoT and big data will enable smart agriculture and is expected to enhance efficiency and productivity .

2.LITERATURE SURVEY

2.1 Existing problem

Smart Farming using IoT, a solution for optimally monitoring farming conditions

The product will assist farmers by getting live data (Temperature, humidity, soil moisture, UV index, IR) from the farmland to take necessary steps to enable them to do smart farming by also increasing their crop yields and saving resources (water, fertilizers). Tools used are ESP32s, DHT11 Temperature, Humidity Sensor, Soil Moisture Sensor, SI1145 Digital UV Index ,IR ,Visible Light Sensor. Technology used is Node MCU.

2020 IEEE International Students' Conference on Electrical,Electronics and Computer Science (SCEECS)

An IoT based advanced solution for monitoring the soil conditions and atmosphere for efficient crop growth is presented. The developed system is capable of monitoring several sensors connected to it. Also, a notification in the form of SMS will be sent to farmer's phone using Wi-Fi about environmental condition of the field. Tools used are temperature sensors, humidity sensors , wireless LAN, soil moisture level monitoring ,microcontrollers, microcontrollers, Smart phones. Technology used is Node MCU

2018 IEEE/ACIS 17th International Conference on Computer and Information Science (ICIS)

The aim of this research is to propose a traceability system, summarising and presenting observed data from the smart farm. The Internet of Things (IoT) has been introduced in this research, using several sensors to detect the environmental data in the smart farm. Tools used are temperature sensors, Agricultural products, Temperature measurement, Intelligent sensors, Humidity sensor, QR codes. Technology used is Raspberry Pi.

Smart Agriculture: IOT based smart sensors agriculture by Anand Nayyar and Er. Vikram Puri, November 2016

A Novel Smart IOT based Agriculture assisting farmers in getting Live Data(Temperature, Soil Moisture) for efficient environment monitoring which will enable them to do smart farming and increase their overall yield and quality of products. Tools used are Water level sensor, Buzzer, LCD, Moisture sensor. Technology used is Arduino UNO.

2.3 Problem Statement Definition

Our objective is to design a IoT Enabled Smart Farming Application which generates messages on different platforms to notify farmers. Our product will assist farmers by obtaining the realtime data from the farmland to take necessary steps during unfavourable conditions. Our proposed product uses NodeMCU, DHT11 Temperature and Humidity Sensor, Soil Moisture Sensor, Relay Coil, AC Motor Pump, Buzzer. Farmers can monitor all the sensor parameters by using a web / mobile application / dashboard even if the farmer is not near his field. Watering the crop is one of the important tasks for the farmers. They can make the decision whether to water

the crop or postpone it by monitoring the sensor parameters and control the motor pumps from the mobile application itself.

3. IDEATION & PROPOSED SOLUTION

3.1 Empathy Map Canvas

3.2 Ideation & Brainstorming

- Temperature and Humidity sensor to detect the temperature and humidity of the soil
- Moisture sensor to detect moisture content of soil
- Trigger the motor to pump water if threshold of moisture sensor is low, through the website
- Using a buzzer to give an alarming sound to indicate danger
- Connecting NodeMCU and IBM Watson cloud to reflect real time values in dashboard that is the cloud
- Send SMS during emergency

PRIORITIES:

- Interfacing all the sensors with the microcontroller

- Controlling the water pump
- Produce an alarming sound during emergency

3.3 Proposed Solution

Our proposed system provides a solution for secure transmission of the real time data obtained from the sensors to the IBM cloud rather than using the networking devices like Zigbee, LORA, GSM modules which causes the interference of data obtained from multiple users. Our product is cost effective, since for communication to farmers we have a web dashboard rather using hardware devices. Our product enables automatic real time decision-making in an environment composed of dozens of thousands of sensors continuously transmitting data through the web dashboard without causing any interference All the IOT end devices are controlled using standalone rechargeable batteries so that the product would last for a long span. The farmer can control his farm irrespective of his place/location

3.4 Problem Solution fit

Project Title: IoT Enabled Smart Farming Application

Project Design Phase-I - Solution Fit Template

Team ID: PNT2022TMD53630

| | | | | |
|--|--|--|--|---|
| Define CS, fit into CC | 1. CUSTOMER SEGMENT(S) CS Farmers are our main customers. With the help of our device the farmer would be in a position to make decisions on his own. | 6. CUSTOMER CONSTRAINTS CC <ul style="list-style-type: none"> • High hardware costs • Security and privacy • Reliability | 5. AVAILABLE SOLUTIONS AS There are several research papers for Smart farming using IOT. The pros in it are real time monitoring of data using various sensors. The cons are the data which are collected by sensors are not securely transmitted to the farmer and most of them use network devices such as ZIGBEE, LORA, GSM which when wind or rain arrives affects the point-to-point communication | Explore AS, differentiate |
| | 2. JOBS-TO-BE-DONE / PROBLEMS J&P <ul style="list-style-type: none"> • Sensors based project-Farmers can't continuously check temperature, humidity, soil moisture levels. • Smart Phone monitoring and consumer interactions: Values change dynamically in the dashboard and it is application-based monitoring with cloud-based system software | 9. PROBLEM ROOT CAUSE RC Farmers need to be monitoring the crops all the time for checking the temperature, humidity and soil moisture values. It increases the manpower in farming. Our system reduces the manpower and is an automatic system so they don't need to interfere in it. | 7. BEHAVIOUR BE <ul style="list-style-type: none"> • The customer needs to find the right product installer. • The farmer needs to know the complete working of the product for better usage and for long life span. | |
| Focus on J&P, tap into BE, understand RC | 3. TRIGGERS TR <ul style="list-style-type: none"> • Irrigation control • Environment monitoring • Soil health | 10. YOUR SOLUTION SL Our product will assist farmers by obtaining the real-time data from the farmland to take necessary steps during unfavorable conditions. Our proposed product uses NodeMCU and real time sensors. Farmers can monitor all the sensor parameters by using a web / mobile application / dashboard even if the farmer is not near his field and do the necessary actions. | 8. CHANNELS of BEHAVIOUR CH <ul style="list-style-type: none"> • If our product becomes successful, we would launch them in websites and hardware stores. • The customers can buy the product through online websites. • The customers can also get the product by visiting the stores. | Focus on BE, tap into TR, understand RC |
| | 4. EMOTIONS: BEFORE / AFTER EM The customers feel unhappy if the product isn't functioning properly during those times, they should not lose hope and confidence, instead they can call the product installer for seeking help. | | | |
| Identify strong TR & EM | | | | Identify strong TR & EM |

4. REQUIREMENT ANALYSIS

4.1 Functional requirement

Following are the functional requirements of the proposed solution

| FR No. | Functional Requirement (Epic) | Sub Requirement (Story / Sub-Task) |
|--------|-------------------------------|--|
| FR-1 | User Registration | Registration through Form Registration through Gmail Registration through LinkedIN |
| FR-2 | User Confirmation | Confirmation via Email Confirmation via OTP |
| FR-3 | User Login | Creating username Creating password Accessing the website |
| FR-4 | Reset Password | Changing the password when user forgot the old password Receiving a link to confirmed mail address or phone number Entering new password |
| FR-5 | User Authentication | Changing password occasionally Adding security questions |
| FR-6 | User logout | Confirmation for logging out Resetting view with generic data |

4.2 Non-Functional requirements

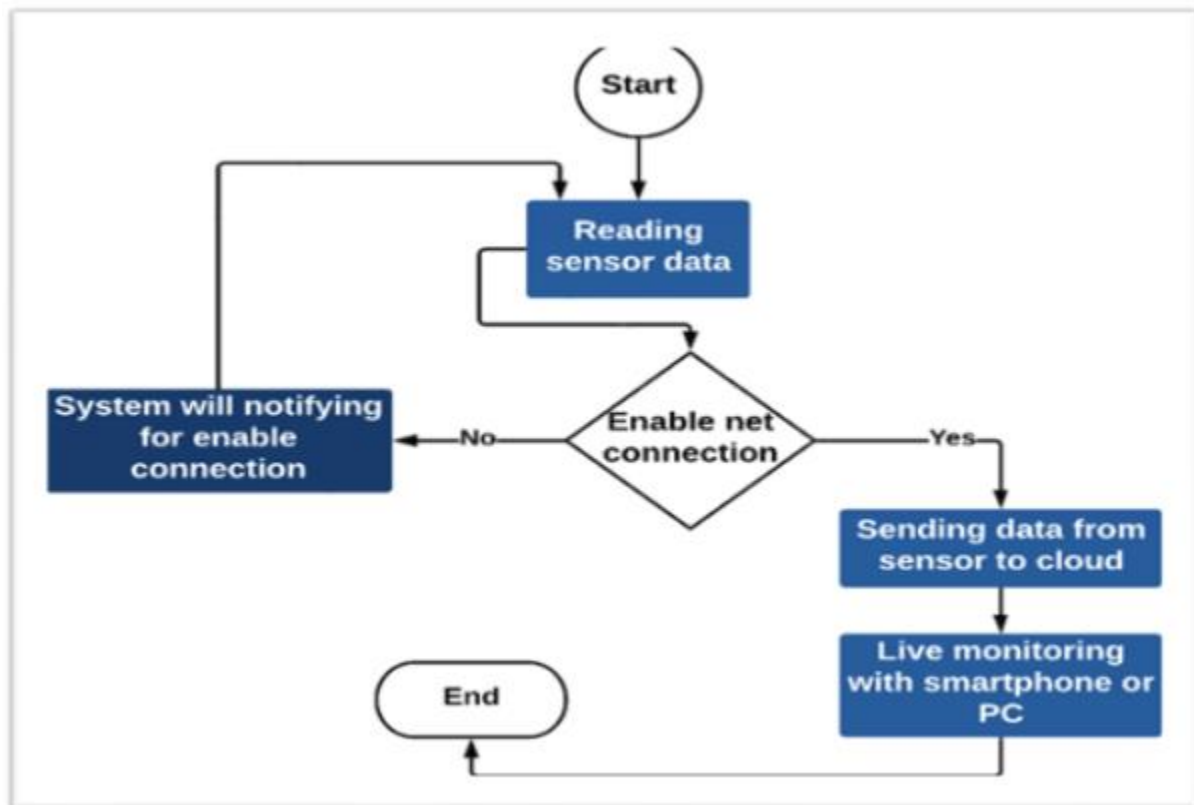

Following are the non-functional requirements of the proposed solution.

| FR No. | Non-Functional Requirement | Description |
|--------|----------------------------|--|
| NFR-1 | Usability | Our product provides the ease at which the users operate the system and make productive use of it since the software and hardware part is easily understandable. |
| NFR-2 | Security | Our product assures that all data inside the system or its part will be protected against malware attacks or unauthorized access by having authentication keys and tokens. |
| | | |

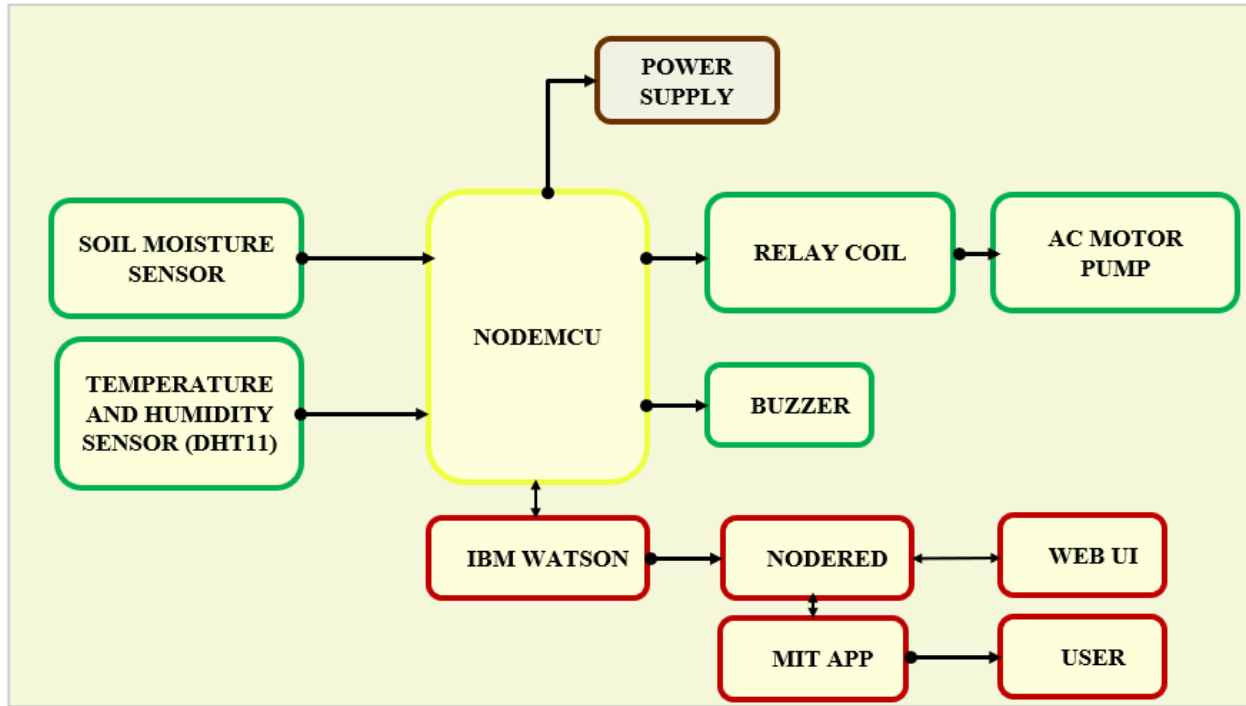

| | | |
|-------|---------------------|--|
| NFR-3 | Reliability | Our product is more reliable because our software system consistently performs the specified functions without any failure |
| NFR-4 | Performance | Our product is capable to provide the necessary functionalities to the users |
| NFR-5 | Availability | Our system is accessible to the user at a given point in time |
| NFR-6 | Scalability | Our product enables continuously transmitting data through web dashboard without causing any interference |

5. PROJECT DESIGN

5.1 Data Flow Diagrams

5.2 Solution & Technical Architecture

5.3 User Stories

| User Type | Functional Requirement (Epic) | User Story Number | User Story / Task | Acceptance criteria | Priority | Release |
|------------------------|-------------------------------|-------------------|--|-------------------------------------|----------|----------|
| Customer (Mobile user) | Registration | USN-1 | As a user, I can register for the application by entering my, email password , and confirming my password. | I can access my account / dashboard | High | Sprint-1 |

| | | | | | | |
|---------------------|--------------|-------|---|---|--------|----------|
| | | USN-2 | As a user, I will receive confirmation email once I have registered for the application | I can receive confirmation email & click confirm | High | Sprint-1 |
| | | USN-3 | As a user, I can register for the application through Facebook | I can register & access the dashboard with Facebook Login | Low | Sprint-2 |
| | | USN-4 | As a user, I can register for the application through Gmail | I can register & access the dashboard with Gmail Login | Medium | Sprint-1 |
| | Login | USN-5 | As a user, I can log into the application by entering email & password | I can access dashboard with email login | High | Sprint-1 |
| | Dashboard | USN-6 | As a user I can enter into dashboard by using navigation panel | I can access the dashboard by using navigation panel | High | Sprint-1 |
| Customer (Web user) | Registration | USN-1 | As a user, I can register for the web application by entering my email, password, and confirming my password. | I can access my account / dashboard | High | Sprint-1 |
| | | USN-2 | As a user, I will receive confirmation email once I have registered for the web application | I can receive confirmation email & click confirm | High | Sprint-1 |
| | Login | USN-3 | As a user, I can log into the web application by entering email & password | I can access dashboard with email login | High | Sprint-1 |

| | | | | | | |
|-------------------------|--------------|-------|--|---|------|----------|
| | Dashboard | USN-4 | As a user I can enter into web dashboardby using navigation panel | I can access into dashboardby using navigation panel | High | Sprint-1 |
| Customer Care Executive | Registration | USN-1 | As a user I can contact the customer care service through phone or mail medium | I can receive confirmation SMS or email | High | Sprint-1 |
| | | USN-2 | As a user I want customer care to answer the questions related to product andservices | I can get the problem solved within a day | High | Sprint-1 |
| | | USN-3 | As a user I want customer care toregister my complaints | I can receive a confirmation message stating my complaint is registered | High | Sprint-1 |
| | | USN-4 | As a user I want customer care to collect and analyze consumer feedback | I can get the status of my feedback | High | Sprint-1 |
| | | USN-5 | As a user I want customer care to troubleshoot technical problems | I can get the problemsolved within a day | High | Sprint-1 |
| Administrator | | USN-1 | As a user I want the administrator to usegood working hardware | I can get a guarantee and warranty card | High | Sprint-1 |
| | | USN-2 | As a user I want the administrator to sellthe product in a reasonable rate | I can get the cost of bill of materials | High | Sprint-1 |
| | | USN-3 | As a user I want the administrator to refund my amount if I am not satisfiedwith the product | I can get an assurance stating I will ge tmy amountback | High | Sprint-1 |

6. PROJECT PLANNING & SCHEDULING

6.1 Sprint Planning & Estimation

| Sprint | Functional Requirement (Epic) | User Story Number | User Story / Task | Story Points | Priority | Team members |
|----------|-------------------------------|-------------------|---|--------------|----------|---|
| Sprint-1 | Registration | USN-1 | As a user, I can register for the application by entering my email, password, and confirming my password. | 2 | High | Revilla Jyosthna, Pannave K, Iyswarya S, Pritha R |
| Sprint-1 | User confirmation | USN-2 | As a user, I will receive confirmation email once I have registered for the application | 1 | High | |
| Sprint-1 | Login | USN-3 | As a user, I can log into the application by entering email & password | 1 | High | |
| Sprint-1 | Simulation creation | USN-4 | Connect hardware devices with esp8266 | 4 | High | |
| Sprint-2 | Dashboard | USN-5 | Real time sensor values are sent to IBM Watson IoT platform and sent to Node-red | 4 | High | |
| Sprint-3 | Software | USN-6 | To develop a mobile application using MIT app | 4 | High | |
| Sprint-3 | Software | USN-7 | Connecting application with Node-Red and further application development | 3 | High | |
| Sprint-4 | Testing | USN-8 | Testing developed application and working model | 2 | High | |

6.2 Sprint Delivery Schedule

| Sprint | Total Story Points | Duration | Sprint Start Date | Sprint End Date (Planned) | Story Points Completed (as on Planned End Date) | Sprint Release Date(Actual) |
|----------|--------------------|----------|-------------------|---------------------------|---|-----------------------------|
| Sprint-1 | 20 | 6 Days | 24 Oct 2022 | 29 Oct 2022 | 20 | 29 Oct 2022 |
| Sprint-2 | 20 | 6 Days | 31 Oct 2022 | 05 Nov 2022 | 20 | 08 Nov 2022 |

| | | | | | | |
|----------|----|--------|-------------|-------------|----|----------------|
| Sprint-3 | 20 | 6 Days | 07 Nov 2022 | 12 Nov 2022 | 20 | 14 Nov 2022 |
| Sprint-4 | 20 | 6 Days | 14 Nov 2022 | 19 Nov 2022 | 20 | 18-19 Nov 2022 |

7.2 SENDING DATA TO IBM WATSON CLOUD

The screenshot displays the Wokwi IDE interface. On the left, the sketch.ino file is open, showing a C++ program that connects to IBM Watson Cloud via MQTT. The code includes libraries for WiFi, PubSubClient, and DHT sensor. It defines IBM credentials (ORG, DEVICE_TYPE, DEVICE_ID, TOKEN) and device information. The program publishes temperature, humidity, and moisture data to a specific topic. The simulation window on the right shows the data being sent and received, including the payload and the status of the publish operation.

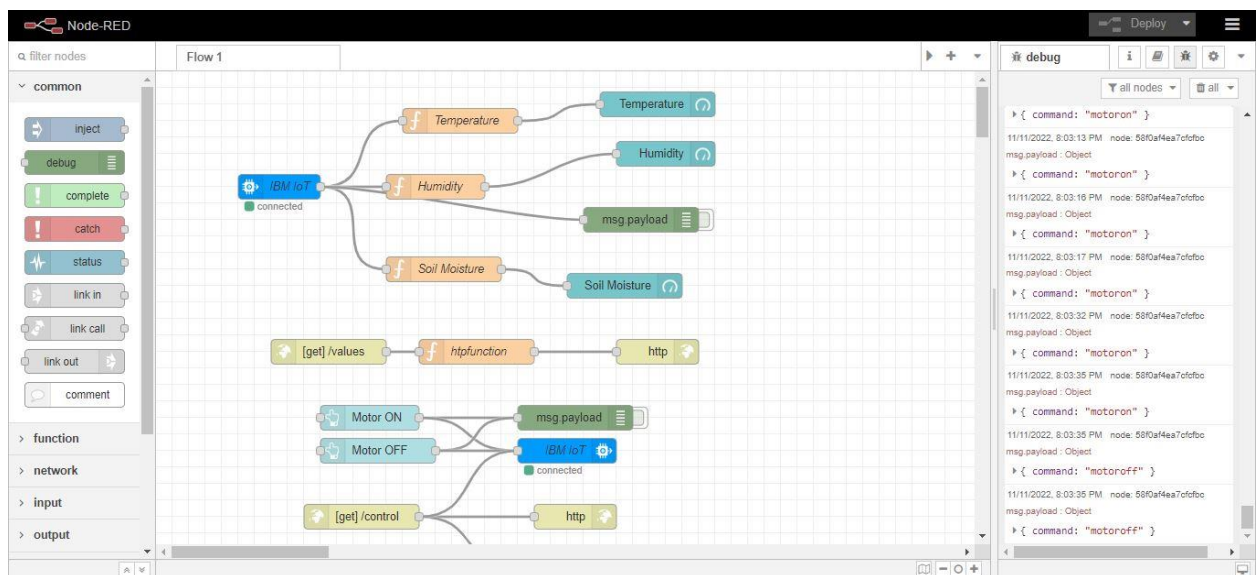

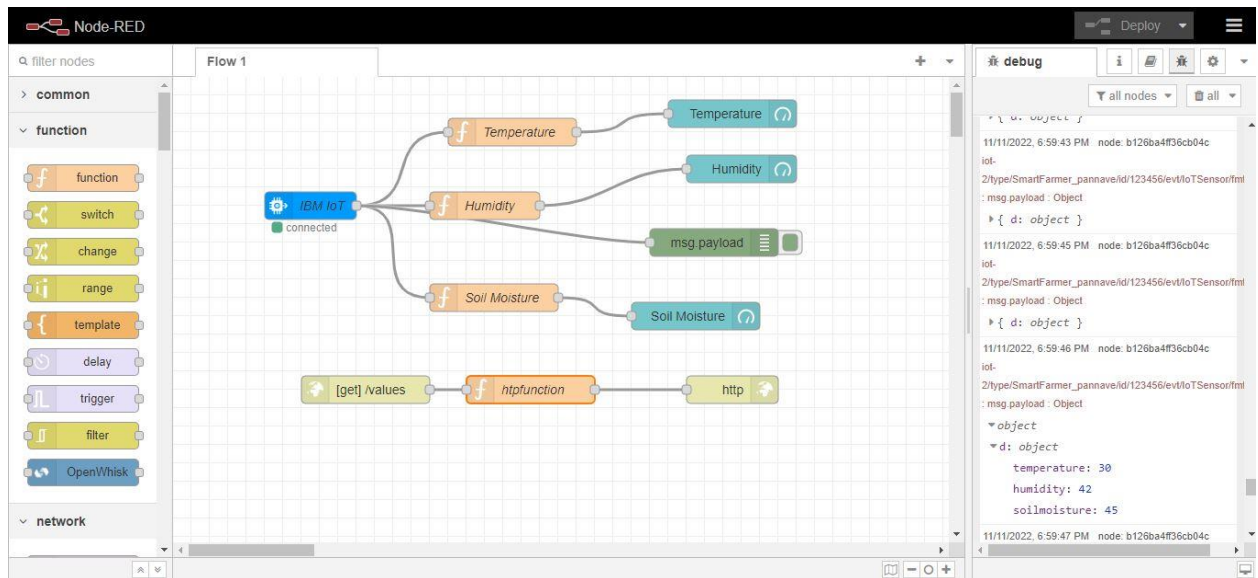

```
1 #include <WiFi.h> //library for wifi
2 #include <PubSubClient.h> //library for MQTT
3 #include "DHTesp.h"
4 const int DHT_PIN=15;
5 DHTesp dhtsensor;
6 int LED=2;
7 void callback(char* subscribetopic, byte* payload, unsigned int payloadlength);

10. ADVANTAGES & DISADVANTAGES

ADVANTAGES

- **Increased Production**

Optimized crop treatment such as accurate planting, watering, pesticide application and harvesting directly affects production rates.

- **Water Conservation**

Weather predictions and soil moisture sensors allow for water use only when and where needed.

- **Real-Time Data and Production Insight**

Farmers can visualize production levels, soil moisture, sunlight intensity and more in real time and remotely to accelerate decision making process.

- **Lowered Operation Costs**

Automating processes in planting, treatment and harvesting can reduce resource consumption, human error and overall cost.

- **Increased Quality of Production**

Analyzing production quality and results in correlation to treatment can teach farmers to adjust processes to increase quality of the product.

- **Accurate Farm and Field Evaluation**

Accurately tracking production rates by field over time allows for detailed predicting of future crop yield and value of a farm.

- **Improved Livestock Farming**

Sensors and machines can be used to detect reproduction and health events earlier in animals. Geofencing location tracking can also improve livestock monitoring and management.

DISADVANTAGES

- The smart agriculture needs availability of internet continuously. Rural part of most of the developing countries do not fulfil this requirement. Moreover internet connection is slower.

- The smart farming based equipments require farmers to understand and learn the use of technology. This is major challenge in adopting smart agriculture farming at large scale across the countries.

11. CONCLUSION

Thus the smart agriculture using IoT will revolutionized the world of farming and it will increase the productivity as well as improve the quality and can save lives of farmer. There is an urgent need for a system that makes the agricultural process easier and burden free from the farmer's side. With the recent advancement of technology it has become necessary to increase the annual crop production output of our country India, an entirely agro centric economy. The ability to conserve the natural resources as well as giving a splendid boost to the production of the crops is one of the main aims of incorporating such technology into the agricultural domain of the country. To save farmer's effort, water and time has been the most important consideration.

12. FUTURE SCOPE

The prospects are high that smart farming will change agriculture in a great way. Smart farming is expected to bridge the gap between large and small-scale farmers in both developing and developed countries. Technological advancement, growth in the internet of things, and the introduction of smartphones have contributed immensely to the adoption of technology in agriculture. Different countries understand the worth of these technologies, which explains why most countries are eager to promote the implementation of precision farming techniques.

There is no doubt that most agricultural operations that were practiced traditionally have changed significantly nowadays. This can be attributed to technological advancement the adoption of smart farming techniques and methodologies such as the use of machines, devices, sensors, and information technology. Presently, farmers make use of sophisticated technologies like aerial images, moisture and temperature sensors, GPS technology and robots. Such technology makes farming not only to be a profitable venture but also an environmentally friendly, safer, and efficient.
